

- **Historical Trade Data**

This dataset contains approximately **211,000 cryptocurrency trading records**, capturing detailed information on individual trades over time. It serves as the primary source for deriving trading behaviour, performance metrics, time-series features, and interaction-based indicators used in the project.

- **Sentiment Data (Fear & Greed Index)**

This dataset contains around **2,600 daily observations**, quantifying market sentiment through investor psychology. It complements the trading data by enabling the extraction of sentiment-based features, such as momentum, contrarian action signals, and regime-aligned performance metrics.

- Throughout the project, several **processed and feature-enhanced datasets** were created to support analysis, modeling, and visualization. These include:

- Aggregated and lagged features at trade and daily levels
- Rolling window and EWMA-based performance indicators
- Trader-centric behavioral profiles and streaks
- Market regime and sentiment dynamics features
- Graph/network-based interaction features
- Fully cleaned, model-ready datasets for predictive modeling

All these CSV files are structured, reproducible, and accessible. They provide a comprehensive record of the transformations applied during the project and are suitable for further analysis or model development.
